

wearezinc.com — Build Description & Handoff

Project: ZINC company website (We Are ZINC) — migrated from Webflow to Next.js/Vercel/Supabase **Repo:** Zincsolutions/wearezinc (GitHub) · **Deploy:** Vercel project wearezinc → <https://wearezinc.vercel.app> **Written:** August 13, 2026 · Audience: any Claude Code session or developer picking up this codebase

1. What this is

wearezinc.com ran on Webflow (site "ZINC Growth Design", ID 695bda13c7c5d5a8fdb4451). In August 2026 it was rebuilt on the ZINC standard stack — **Next.js 16 (App Router, TypeScript, Tailwind v4, src/ layout) on Vercel, with Supabase for content and form storage** — following the same "stealth migration" playbook as Zincsolutions/predictant :

- **Phase A (done):** pixel-identical port of the live Webflow site, verified by automated screenshot diffing. The rebuild is visually indistinguishable from the original except where bugs were deliberately fixed.
- **Phase B (future):** refactor internals into proper components without visual change.

As of this writing, DNS cutover has NOT happened. wearezinc.com still points at Webflow; the rebuild lives at wearezinc.vercel.app. The Webflow subscription stays active until after cutover.

2. Architecture

migration/webflow/	Read-only snapshot of the live Webflow site (Aug 12, 2026):
pages/*.html	all 50 rendered pages incl. 404
assets/	553 CDN assets
cms/*.json	CMS collections export (posts, categories, resources...)
manifest.json	capture manifest
public/_wf/	PROCESSED static pages served via next.config.ts rewrites
public/wf/	all self-hosted assets (nothing references Webflow's CDN)
public/vendor/	pinned gsap 3.13.0 + split-type 0.3.4 (self-hosted)
public/js/zinc-forms.js	form interceptor (posts to /api/forms)
src/templates/	processed blog templates (post.html, blog.html)
src/lib/content.ts	Supabase queries (anon key; RLS hides drafts)
src/lib/render.ts	cheerio templating: Supabase content → Webflow markup
src/app/blog/route.ts	listing: 12/page, param `?190f5589_page=N` (Webflow's original)
src/app/post/[slug]/	post pages (ISR 300s) with OG tags + Article JSON-LD
src/app/api/forms/	form endpoint: Supabase insert + HubSpot upsert + Note
src/app/sitemap.ts	sitemap from real routes + published posts
scripts/	capture-webflow.py, port-webflow.mjs, import-cms.mjs, seo-overrides.json, qa-diff.mjs, qa-diff-one.mjs
supabase/migrations/	schema (versioned; applied via `supabase db push`)

The regeneration pipeline: scripts/port-webflow.mjs transforms the snapshot into public/_wf/ + src/templates/. It applies, in order: asset URL rewriting to /wf/, SRI stripping, removal of the old srcset-stripping script, replacement of the fragile GSAP reveal with a defensive snippet (scripts/reveal-snippet.html), GA4 proxy → real gtag.js, OG/JSON-LD injection, approved metadata overrides (scripts/seo-overrides.json), and forms-script injection. **Never hand-edit files in public/_wf/ — edit the port script and re-run it.**

Static pages are complete HTML documents served by rewrites (next.config.ts reads public/_wf/manifest.json). They never touch the React tree. **Blog pages** are rendered at request time by string/DOM templating (cheerio) from Supabase content through the captured Webflow templates — visually identical, CMS-driven.

3. Data (Supabase)

Project ref juebigedqzpgtomlaygh (<https://juebigedqzpgtomlaygh.supabase.co>). Tables (all RLS-enabled): posts (22: 16 published, 6 draft), categories (5), post_categories , post_related , resources (5, all draft — see Open Items), form_submissions (service-role only; no anon policies).

Public reads use the **anon key** so RLS guarantees drafts never leak. Content images were rewritten to self-hosted `/wf/` paths at import (`scripts/import-cms.mjs` , idempotent, re-runnable). Schema changes go through `supabase/migrations/` + `supabase db push` (CLI is linked; login via `supabase login`).

4. Forms pipeline

`public/js/zinc-forms.js` intercepts every Webflow-styled form (capture-phase listener beats `webflow.js`), POSTs JSON to `/api/forms` , and drives the original `.w-form-done` / `.w-form-fail` UX. The API route: honeypot (`website` field) → rate limit (10/10min/IP, per-instance) → insert into `form_submissions` → HubSpot contact create-or-update (portal **2098094**, na2) → form message attached as a **Note** on the contact. HubSpot failures never fail the user; rows are flagged via `hubspot_synced` .

Verified end-to-end Aug 13, 2026 (test contact `migration-test@wearezinc.com` , HubSpot id 534809518795 — deletable).

5. Environment variables

Values live in Vercel (production/preview/development) and gitignored `.env.local` . Names only:

- `NEXT_PUBLIC_SUPABASE_URL` , `NEXT_PUBLIC_SUPABASE_ANON_KEY` — public reads (RLS-guarded)
- `SUPABASE_SERVICE_ROLE_KEY` — form inserts (server only)
- `HUBSPOT_PRIVATE_APP_TOKEN` — HubSpot service key (contacts + notes scopes)

6. Decisions log (why things are the way they are)

1. **Source of truth = live published site** as of Aug 12, 2026. ~4 weeks of unpublished Webflow Designer edits were deliberately excluded (user decision).
2. **Dropped pages** (user decision): `/blog-cats` , `/lander-1` , `/lander-2` , `/partners-3` (duplicate). 301s: `/partners-3` → `/partners/partners-2` , `/thomabravo` → `/work/thomabravo` (moved under `/work/`), junk → `home/blog`.
3. **Post dates show the editorial `publish-date` CMS field**. The old Webflow template displayed the last-*republish* timestamp, which reset on every site publish (14 of 16 posts all showed "July 1, 2026"). Intentional improvement; dates on some posts differ from the old site.
4. **Featured-post quirk**: the post "Why Strategy Beats Speed in the AI Era" has slug `maximize-your-digital-presence-today` (renamed post, original slug kept for URL parity). It's the `featured=true` hero and is excluded from the listing grid.
5. **Blog listing order** replicates Webflow: `sort_order asc` with nulls first (nulls sub-sorted newest-first), ties oldest-first. Category pill order is the template's original, hardcoded in `content.ts` (`CATEGORY_ORDER`).
6. **Pagination** is server-side, 12/page, using Webflow's original query param `?190f5589_page=N` (also accepts `?page=N`) so Finsweet List (loaded from `jsdelivr`, `@finsweet/attributes@2`) can fetch/filter across pages exactly as before.
7. **FullStory (org 97GDT) + Hotjar (250039) both kept** (user decision) — embedded in the ported page heads; same IDs, so recordings continue post-cutover. GA4 `G-H4WRSH6E2G` via standard `gtag.js` (the old Webflow first-party proxy doesn't exist off-platform).
8. **"AI" not "Ai"** in any copy this build touches (old site was inconsistent).
9. **Webflow forms backend abandoned** — forms would silently die when the Webflow subscription ends; ours is platform-independent.

7. Bugs fixed during the port (from the Aug 2026 site audit)

- **Z-01 (critical)**: old text-reveal could leave headlines permanently invisible (CDN-loaded GSAP + ScrollTrigger, killed by resize, no fallback — confirmed in FullStory recordings). Rebuilt: IntersectionObserver trigger, self-hosted pinned libraries, 2.5s force-reveal failsafe, markup restored after animation (resize-proof), `prefers-reduced-motion` honored. Same visual animation.
- **Z-02 (critical)**: a site-wide script stripped `srcset` / `sizes` from every image. Removed; responsive images restored.
- **Z-03/Z-04**: `og:image` everywhere, Organization + WebSite + Article JSON-LD.
- **Z-08**: 18 pages of user-approved titles/descriptions (`scripts/seo-overrides.json`).
- Old sitemap listed a 404ing draft URL; new sitemap generates from real routes.

8. QA results (Aug 13, 2026)

- **60 full-page screenshot comparisons** vs the live site (`scripts/qa-diff.mjs`): 44 under 5% pixel difference (many ~0%). Residual diffs on animated pages are the *old* site failing to render its own headlines in headless Chromium (its Z-01 bug) plus the intended date fix.

- Redirect map verified (308s). Forms verified E2E (Supabase row + HubSpot contact + note).
- Lighthouse (home, mobile sim): new **62/96/96/100** vs old **59/96/96/100**; LCP 7.5s vs 9.8s. Perf headroom is Phase B (font loading chain, hero image, tracker weight).

9. Open items

1. **DNS cutover** — user-gated. Steps: final click-through → add domains in Vercel → flip DNS at registrar → monitor → cancel Webflow after a safe window.
2. **Alt text on static pages (Z-07)** — blog/post images have real alts; the 28 ported static pages still carry the old site's empty `alt=""`. Needs a content pass (edit via the port script, not `public/_wf/` directly).
3. **Resources section** — 5 finished items sit as drafts in Supabase; the section was never reachable on the old site (listing page was a Webflow draft). Decide: build `/resources` or delete the content.
4. **6 draft blog posts** in Supabase awaiting a publish decision (flip `status` to `published`; they appear automatically via ISR).
5. **Deploys:** all production deploys so far ran via `npx vercel deploy --prod --yes` (CLI, logged in as `zincsquad`). The GitHub→Vercel connection reports connected but auto-deploy-on-push was not reliably observed — verify or keep using the CLI. Framework preset is pinned in `vercel.json` (the dashboard had "Other", which silently breaks Next.js routing — don't remove it).
6. **Finsweet attributes** load unpinned-major from jsdelivr (`@2`) — consider pinning exact version + self-hosting (same treatment gsap/split-type got).
7. **Phase B:** componentize pages, `next/image`, `next/font`, consolidate FullStory/Hotjar + consent gating (GDPR exposure flagged in the audit).

10. Useful commands

```
npm run dev                # dev server (Turbopack) :3000
npm run build              # production build
node scripts/port-webflow.mjs  # regenerate public/_wf + templates from snapshot
node scripts/import-cms.mjs   # (re)import CMS snapshot into Supabase – idempotent
node scripts/qa-diff.mjs      # full visual sweep vs live site → qa/
node scripts/qa-diff-one.mjs /blog # diff one path
supabase db push            # apply new migrations
npx vercel deploy --prod --yes  # production deploy
```

11. Related context

- The Webflow site remains the live production site until cutover; its Designer still contains the unported unpublished edits if ever needed.
- The original site audit (18 findings, Z-01...Z-18) and this migration were run via Claude Code on the Mac mini ("ZINC Brand & Site" project folder), Aug 12–13, 2026.
- Sibling migration reference: `ZincSolutions/predictant` (same playbook).
